

WORKSUITE

One app to run People, Money, Equipment & Projects

A plain-English guide for the sales team — what Worksuite does, who it is for, and how to talk about it in a conversation with a customer.

Projects

Internal sales enablement document

1 The 30-Second Pitch

What to say in the first minute of a conversation

"Worksuite is one web app that replaces four or five separate tools a growing company usually juggles — one for HR, one for accounting, one for tracking laptops and equipment, and a spreadsheet for managing projects. Instead of switching between logins and re-typing the same information, everything lives in one place and the pieces talk to each other automatically."

Who buys it

Operations leaders, founders, and HR/Finance heads at small-to-mid-size businesses (roughly 20 to 500 employees) who are still running HR, accounting, IT asset tracking, and project delivery in disconnected spreadsheets, WhatsApp groups, or three different SaaS logins.

The problem it solves

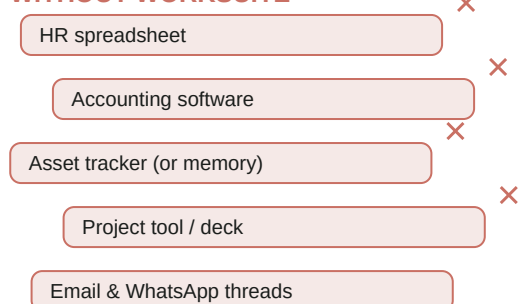

Information is scattered. HR does not know which project an employee is billed to. Finance does not see that a laptop write-off should hit a department budget. Project managers do not know if their team is overloaded on other projects. Worksuite connects all of it, so one number (a budget, a headcount, an asset) means the same thing everywhere in the company.

The one-line summary

"See your whole business — your people, your money, your equipment, and your projects — on one screen, updated in real time, instead of five."

The picture to show a prospect

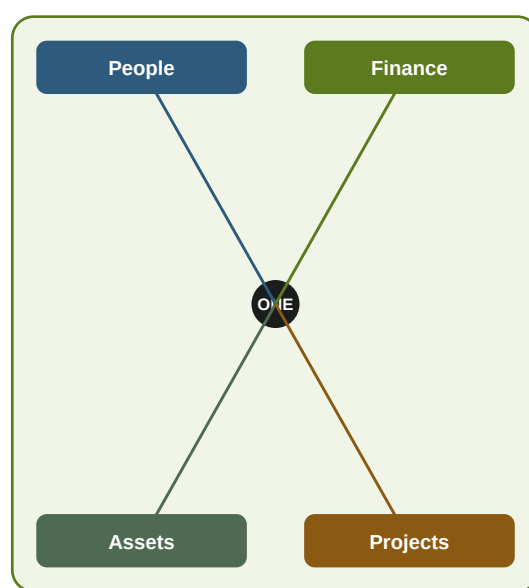

WITHOUT WORKSUITE

Disconnected — nothing updates anywhere else

WITH WORKSUITE

One shared database — everything updates together

Why this matters to a buyer

- Less busywork: information is entered once and shows up everywhere it is needed — no more copying numbers between spreadsheets.
- Fewer surprises: because money, people and projects are linked, a manager can see a project running over budget the same week it happens, not at month-end.
- One login, one bill, one place to train new staff — instead of separate subscriptions for HR software, accounting software, and a project tool.
- Everyone sees the same version of the truth — the CEO, the finance head and the project manager are all looking at the same live numbers.

2 The Four Building Blocks

Worksuite is organised into four connected modules — think of them as four departments under one roof

People (HR)

Everything about hiring, managing and paying staff — profiles, attendance, leave, recruitment and monthly payroll.

Finance

The money side — client invoices, staff expense claims, company bills, department budgets and financial reports.

Assets

The company's physical belongings — laptops, phones, furniture — who has them, their condition, and stock on hand.

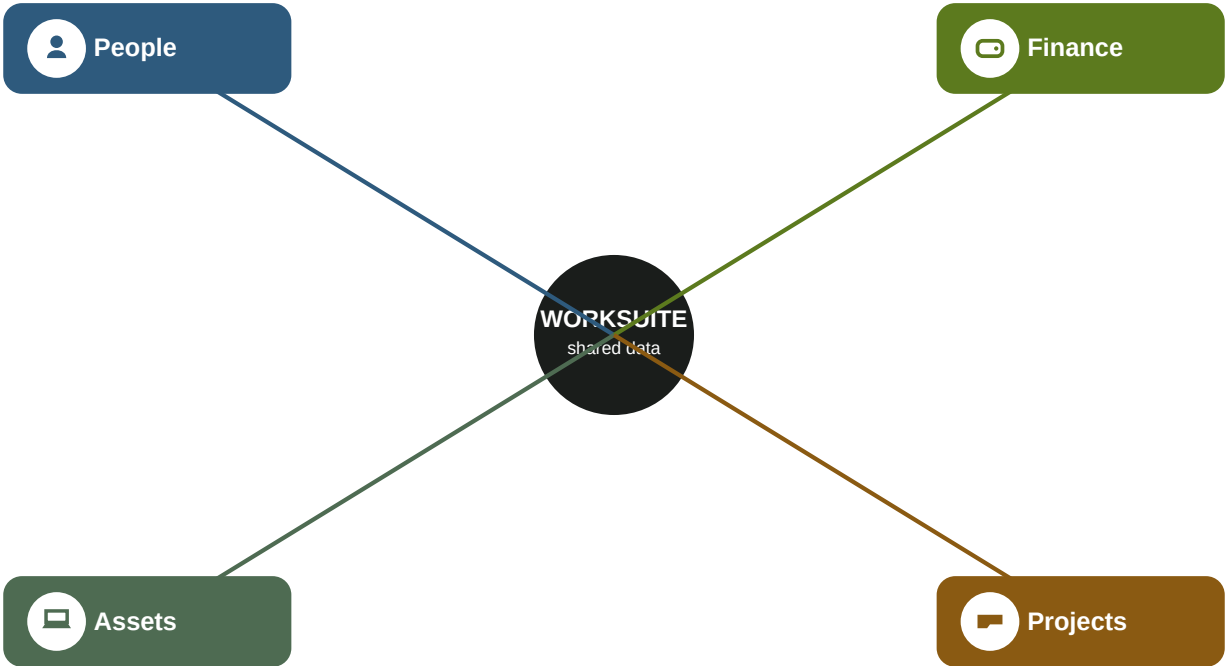

Projects

Where the work actually gets delivered — timelines, budgets, team workload, and whether a project will finish on time.

How the four modules connect

This is the real selling point: the modules are not four separate tools bolted together — data flows between them automatically, through one shared system.

Payroll → Finance	Monthly salary costs automatically feed into company cash-flow reports.
Expenses & bills → Budgets	Every approved expense claim and company bill rolls up into the relevant department budget, live.
Assets → Finance	Equipment purchases and write-offs show up as spend in financial reports.
Employees → Projects	The people in the HR directory are the same people who get staffed onto projects.
Assets → Projects	Equipment assigned to a project is tracked as part of that project's resources.
Budgets → Projects	Department budgets fund the projects — so a project's spend is never a mystery number.

Sales tip: when a prospect says "we already have accounting software" or "we already use a project tool," the answer is not to compete feature-for-feature — it is to ask what happens *between* their tools today. That gap is where Worksuite wins.

3 People (HR) Module

Everything needed to manage a workforce, from hiring to payday

What's inside

- **Dashboard** — A single screen showing headcount, who is present today, and payroll status — the first thing an HR manager opens each morning.
- **Employees** — A searchable directory of every staff member with a full profile — role, department, contact details and history.
- **Attendance** — Daily check-in and check-out tracking, so it is always clear who is at work, working remotely, or absent.
- **Leave** — Staff submit leave requests here; managers approve or decline them, and running leave balances are tracked automatically.
- **Recruitment** — A simple pipeline for open roles and candidates — from application through to hire.
- **Payroll** — Runs the monthly salary process and generates payslips for every employee.

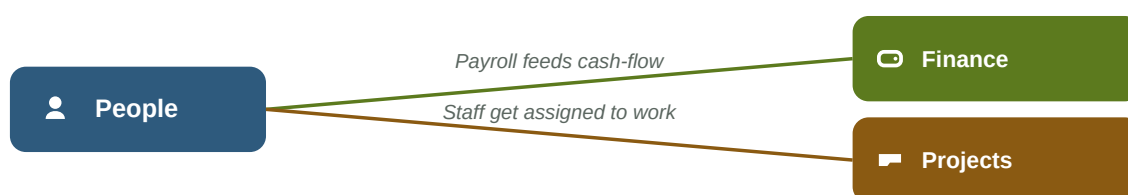

Who this module is for

HR managers and business owners who currently track staff in spreadsheets, or juggle a separate attendance app, a separate payroll provider and a separate hiring tracker.

Talking points for prospects

- One employee record — no re-typing the same person's details into three different systems.
- Leave approvals happen in the same place attendance is tracked, so there's no double-booking or confusion about who is actually available.
- Payroll numbers flow straight into the company's financial reports — finance never has to chase HR for a spreadsheet at month-end.

Where People connects to the rest of Worksuite

4 Finance Module

A clear, live picture of money coming in and going out

What's inside

- **Dashboard** — An at-a-glance view of revenue, expenses and cash position — the finance team's morning check-in.
- **Invoices** — Track what has been billed to clients and whether it has been paid, is pending, or is overdue.
- **Expense Claims** — Employees submit reimbursement requests here, which move through submitted → approved → reimbursed — no chasing paper receipts.
- **Track Expenses** — Company overhead bills (rent, subscriptions, utilities) organised by category, month by month.
- **Budgets** — Every department's budget shown next to what it has actually spent, so overspending is caught early, not discovered later.
- **Reports** — Financial trends over time, ready to export and share — no manual spreadsheet-building required.

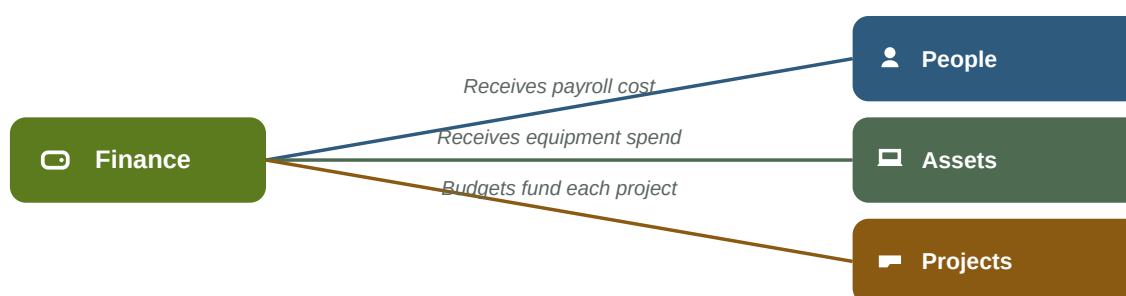

Who this module is for

Finance managers, controllers and business owners tired of manually reconciling invoices, expense receipts and budget spreadsheets that are always a week out of date.

Talking points for prospects

- Overdue invoices are flagged automatically — nothing falls through the cracks because someone forgot to check a spreadsheet.
- Expense claims have a clear approval trail, so there's no argument later about who approved what.
- Budgets update themselves as money is spent — no more finding out about an overspend a month after it happened.

Where Finance connects to the rest of Worksuite

5 Assets Module

Know exactly what the company owns, who has it, and its condition

What's inside

- **Dashboard** — A quick health check of all company equipment — how much is in use, in good condition, or needs attention.
- **Inventory** — The full register of every asset (laptops, phones, furniture, tools) — who it is assigned to, and full detail on demand.
- **Stock** — Levels of consumable supplies the company keeps on hand — so nobody runs out of essentials unexpectedly.

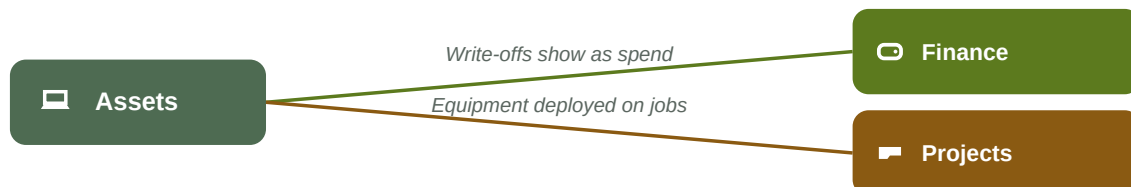

Who this module is for

Operations and IT teams who currently track "who has which laptop" in a spreadsheet — or worse, from memory.

Talking points for prospects

- No more "who has the spare laptop?" moments — every asset has a clear owner and status.
- When an asset is retired or written off, that cost automatically shows up in the finance reports — nobody has to remember to log it twice.
- Equipment handed out for a specific project is tracked as part of that project's resources, so project costs are accurate.

Where Assets connects to the rest of Worksuite

6 Projects Module

See how people, equipment and money come together to deliver work — and whether it will finish on time

What's inside

- **Mission Control (Dashboard)** — The big picture — overall portfolio health, a visual "race to the finish line" for every project, today's key updates, and a league table of top-performing projects.
- **Portfolio** — Every project listed with its budget, how much has been allotted and used, and a projected finish date.
- **Timeline** — A waterfall-style chart of every project side by side — planned schedule, actual progress, and any projected delays, all in one view.

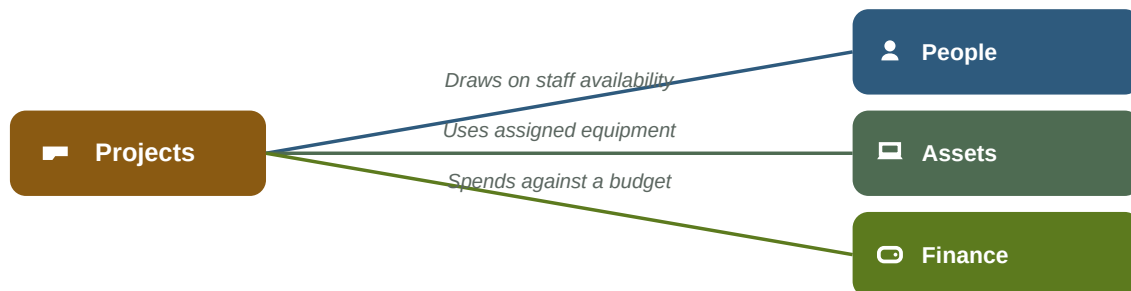

Who this module is for

Project managers, delivery leads and agency owners juggling multiple projects who need one place to see if everything is on track — instead of chasing five separate spreadsheets or status decks.

Talking points for prospects

- A project's true cost is visible immediately, because staff time, equipment and budget all connect to the same project record.
- The "race to the finish line" view makes it instantly obvious which projects are ahead, on pace, or falling behind — no need to read a status report.
- Leadership can see the whole project portfolio on one screen instead of asking each project manager for a separate update.

Where Projects connects to the rest of Worksuite

7 Features That Work Across the Whole App

Not tied to one module — these make the everyday experience feel effortless

Convenience features

- **Universal search** — Press Ctrl+K (or click Search) from anywhere and instantly find an employee, invoice, asset or project by name — no need to know which module it lives in.
- **One login, role-based access** — Each person logs in once and only sees the modules relevant to their job — an HR manager does not see finance data unless they are meant to, and vice versa. This also means a smaller team can be given a lighter, focused view.
- **Notifications** — A bell icon surfaces what needs attention right now — pending leave approvals, a payroll draft ready for review, overdue invoices, upcoming compliance deadlines.
- **Built-in AI assistant ("Nova")** — A chat assistant available on every screen that can answer questions about the data in plain language — like asking a colleague instead of digging through menus.
- **Smart dashboards with built-in insight** — Dashboards do not just show numbers — they highlight what changed and what needs action, for example flagging when attendance dips or when hiring pipelines are closing faster than usual.
- **Help & Overview page** — A built-in, plain-language map of the whole app, showing what everything does and how the modules connect — useful for onboarding new users quickly.
- **Works on any device** — Runs in a web browser — no software to install, and it adapts cleanly to desktop, tablet or phone.

Example roles and what they see

Role	What they can access
Super Admin	Everything — People, Finance, Assets and Projects
HR Admin	People and Assets
Finance Admin	Finance only
Production Manager	Assets only (stock & inventory)
Project Director	Projects and Assets

8 Why Customers Choose Worksuite

The core reasons a prospect says yes — and how to answer the common pushback

The five reasons customers buy

- **Everything in one place** — no more logging into four different apps and re-entering the same information.
- **Real-time, not month-end** — budgets, attendance and project status update live, not after someone compiles a report.
- **One version of the truth** — the CEO, the HR head and the finance head are always looking at the same numbers.
- **Faster onboarding** — new hires learn one system instead of five, and the built-in Help page and AI assistant reduce training time.
- **Grows with the company** — role-based access means it works for a 20-person team and scales cleanly as headcount grows.

Common questions — and simple answers

"We already use [Tool X] for accounting/HR/projects."

Ask what happens between that tool and everything else. Worksuite's advantage isn't doing one thing better in isolation — it's that People, Finance, Assets and Projects all update each other automatically, which single-purpose tools can't do.

"Is this hard to set up or learn?"

No installation is required — it runs in a browser. Each person only sees the modules relevant to their role, so there is less to learn on day one, and the in-app Help page and Nova assistant answer most questions without needing a manual.

"Will it work for a small team?"

Yes — role-based access means a 20-person company can turn on just the modules they need (for example, just People and Finance) and add more as they grow.

"How is this different from a project management tool?"

Project tools track tasks and timelines but rarely know the real cost of a project. Worksuite connects the project to the actual people and budget behind it, so cost and delivery are seen together, not separately.

9 Quick Reference

A one-page cheat sheet to glance at before a call

Module	One-line description	Best for
People	Manage hiring, attendance, leave and payroll	HR managers, business owners
Finance	Track invoices, expenses, budgets and reports	Finance managers, controllers
Assets	Track equipment ownership, condition and stock	Operations & IT teams
Projects	See delivery progress, budget and team workload	Project managers, agency leads

The memory-jog version of every module

- **People** — Dashboard, Employees, Attendance, Leave, Recruitment, Payroll
- **Finance** — Dashboard, Invoices, Expense Claims, Track Expenses, Budgets, Reports
- **Assets** — Dashboard, Inventory, Stock
- **Projects** — Mission Control, Portfolio, Timeline

Platform features to always mention

- Universal search (Ctrl+K) — find anything instantly
- Role-based access — each person sees only what's relevant to them
- Nova, the built-in AI assistant — answers questions in plain language
- Live dashboards with built-in insight — not static reports
- No installation — works in any browser, on any device

Closing line to use on a call: *"Instead of five logins and five spreadsheets that never quite match, Worksuite gives your whole company one live picture of your people, your money, your equipment and your projects."*
